

Standex® Color Variant Documentation.

Sprayed chips that deliver more accurate color representation.

Standex Color Variant documentation is available in a sprayed format, which more accurately represents the color formula compared to the drawn down format.

Each large variant color chip includes a page number, in addition to the manufacturer information. As a result, you use the same easy method to locate the correct variant page from the Unifers® Color Retrieval System.

The color variant chips are classified by manufacturer and assembled on metal rings, which are just as easy to update as the current Standox color variant documentation. The rings hang in a metal cabinet to keep them clean and free of dust. In addition, the cabinet can be wall mounted in order to save valuable workspace in the mixing room.

Features and Benefits

- Improved accuracy with sprayed chips. Sprayed color chips more accurately represent the actual color formula compared to drawn down color chips.
- Easy-to-use documentation system. The metal ring format an cabinet system is intuitively easy-to-use, understand and update.
- Comprehensive selection of chips. There are more than 5,000 chips on over 50 rings in each cabinet, covering 1995-2004 to start.
- Twice as many updates. The sprayed color variant documentation is updated twice a year compared to just once a year with the previous format.
